

BME3321:Introduction to Microcontroller Programming

Introduction

Assist. Prof. Dr. İsmail Cantürk

The Definitive Guide to ARM® Cortex®-M0 and Cortex-M0+ Processors (ch1,2,3,4,7)

Course overview

What is a Microcontroller?

- A microcontroller is a small computer which has
 - processor,
 - memory,
 - programmable peripherals (i.e., input/output)

Atmel AVR

AVR

ATX Mega

ATmega 328P

PIC 18F877A

8051

Arduino

ARM

Course overview

What is a Microcontroller?

- Used for specific (embedded) applications like...

Course overview

- We are going to learn about ARM- Cortex Microcontrollers

Architecture, peripherals (General purpose I/O (GPIO), Interrupts, Timers, USART...), and programming

- References:

			1	0

Number systems

- Digital systems are binary based
 - Each data is represented using bits
 - A bit can be 1 or 0 (on or off)
- Digital data can also be represented in: Binary (base 2), Decimal (base 10), Hex (base 16)

for readability

Decimal	Binary	Hex
0	0000	0x0
1	0001	0x1
2	0010	0x2
3	0011	0x3
4	0100	0x4
5	0101	0x5
6	0110	0x6
7	0111	0x7
8	1000	0x8
9	1001	0x9
10	1010	0xA
11	1011	0xB
12	1100	0xC
13	1101	0xD
14	1110	0xE
15	1111	0xF

Mostly used
ones in
microcontroller
programming

Binary to decimal conversions

1 1 0 1 1 0 1 1 Binary to Decimal

$1 \times 2^0 = 1 \times 1 = 1$
 $1 \times 2^1 = 1 \times 2 = 2$
 $0 \times 2^2 = 0 \times 4 = 0$
 $1 \times 2^3 = 1 \times 8 = 8$
 $1 \times 2^4 = 1 \times 16 = 16$
 $0 \times 2^5 = 0 \times 32 = 0$
 $1 \times 2^6 = 1 \times 64 = 64$
 $1 \times 2^7 = 1 \times 128 = 128$

$1 + 2 + 8 + 16 + 64 + 128 = 219$

$(11011011)_2 = (219)_{10}$

© w3resource.com

General formula for decimal conversions:

$$(n_{N-1}n_{N-2} \dots n_2n_1n_0)_b \rightarrow$$
$$n_0xb^0 + n_1xb^1 + n_2xb^2 + \dots + n_{N-1}xb^{N-1}$$

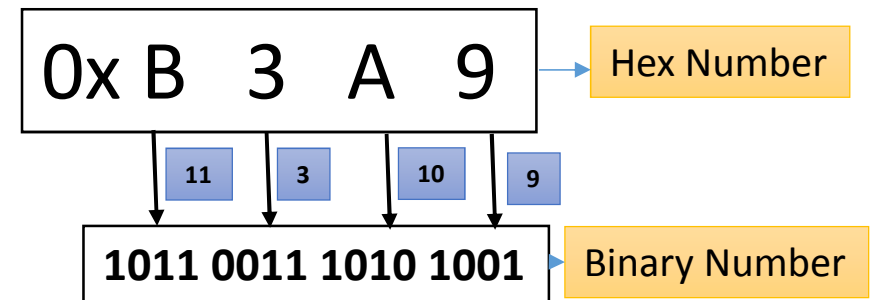

b: base (for binary 2, for hex 16)

Hex to Binary - Binary to Hex conversions

- Hex numbers are denoted with **0x...**
- Each hex value* is represented with **4 binary bits**.

To not confuse with other numbering systems

Examples:

- Decimal numbering system can be used as a tool for binary to hex and hex to binary conversions.

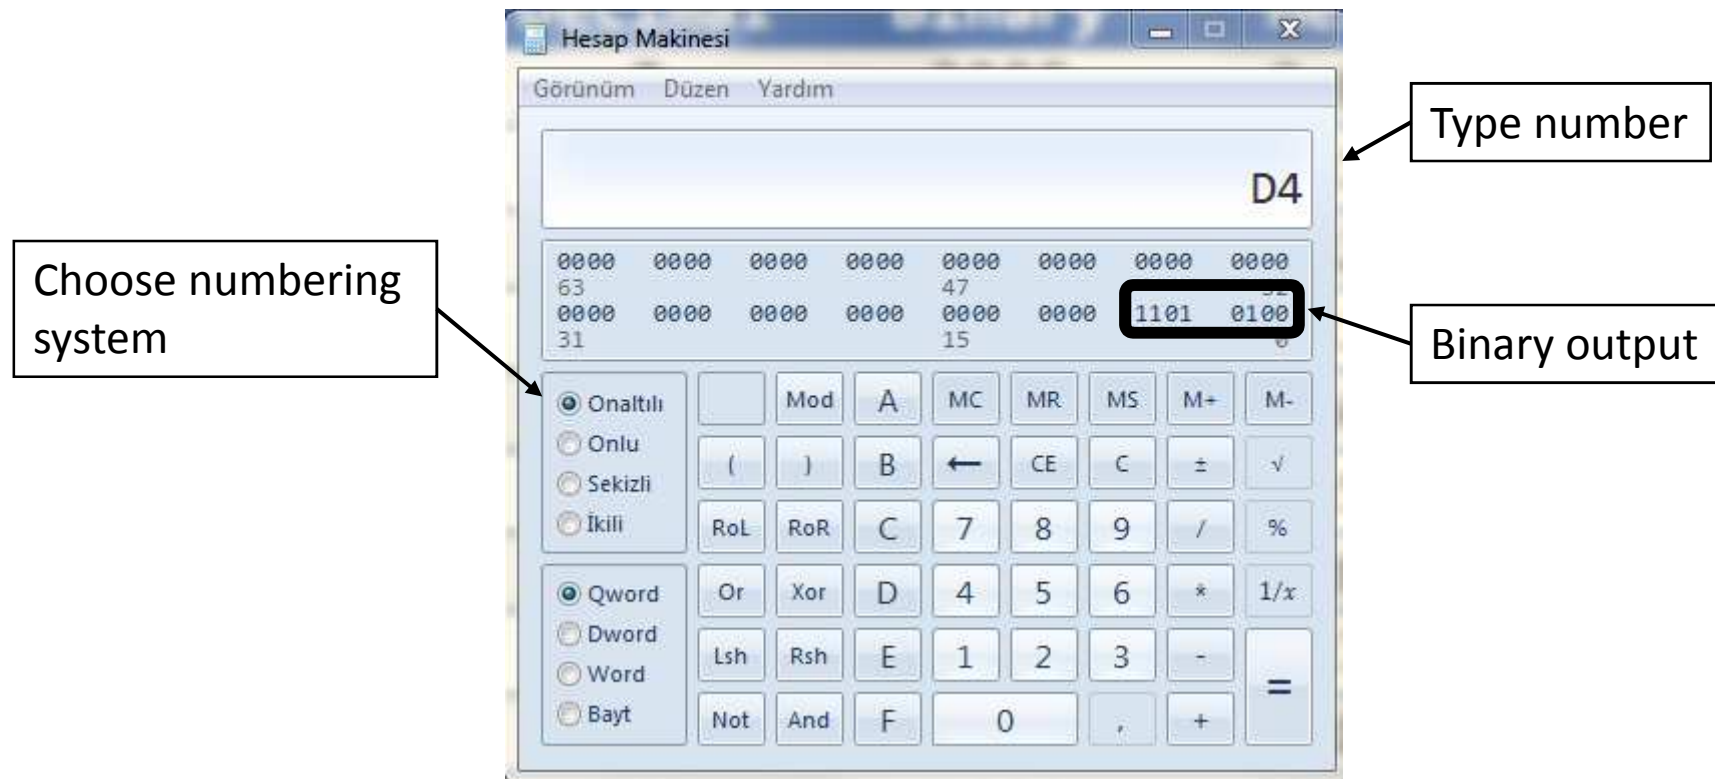

Microcontroller programming with Hex numbering system

Use conversion table

Decimal	Binary	Hex
0	0000	0x0
1	0001	0x1
2	0010	0x2
3	0011	0x3
4	0100	0x4
5	0101	0x5
6	0110	0x6
7	0111	0x7
8	1000	0x8
9	1001	0x9
10	1010	0xA
11	1011	0xB
12	1100	0xC
13	1101	0xD
14	1110	0xE
15	1111	0xF

Windows calculator for conversions

- After typing the number, conversion can be done by selecting desired numbering system

Counting in different numbering systems

- Decimal

0,1,2,3,4,5,6,7,8,9,10,11,12...,19,20,21,...,29,30,...,39....

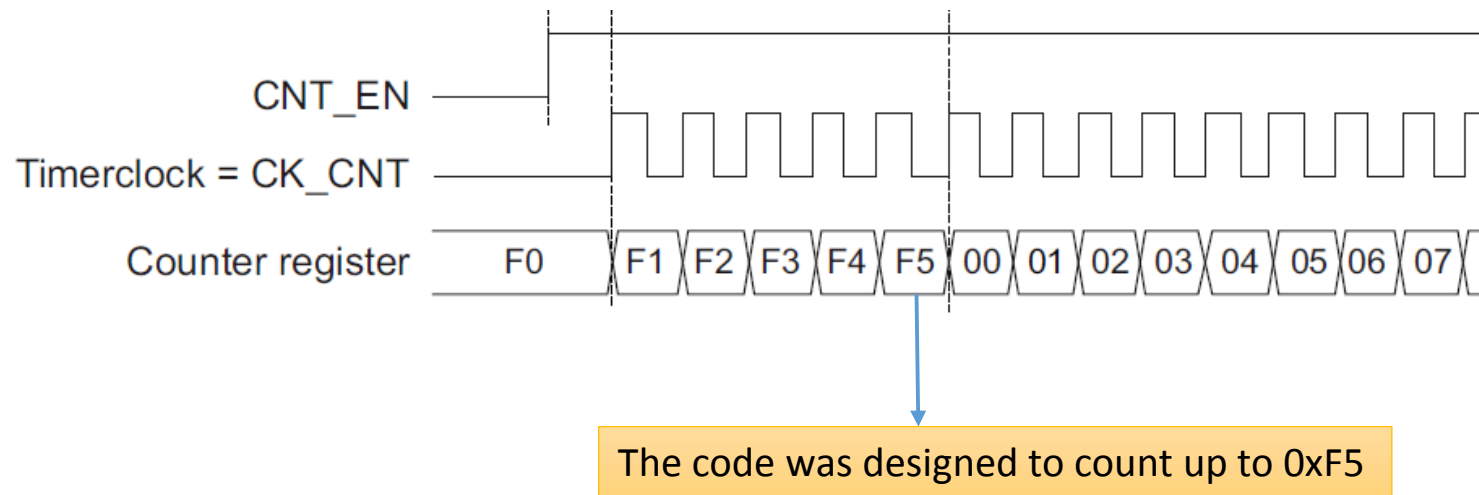

- Binary

0,1,10,11,100,101,110,111,1000,....

- Hexadecimal

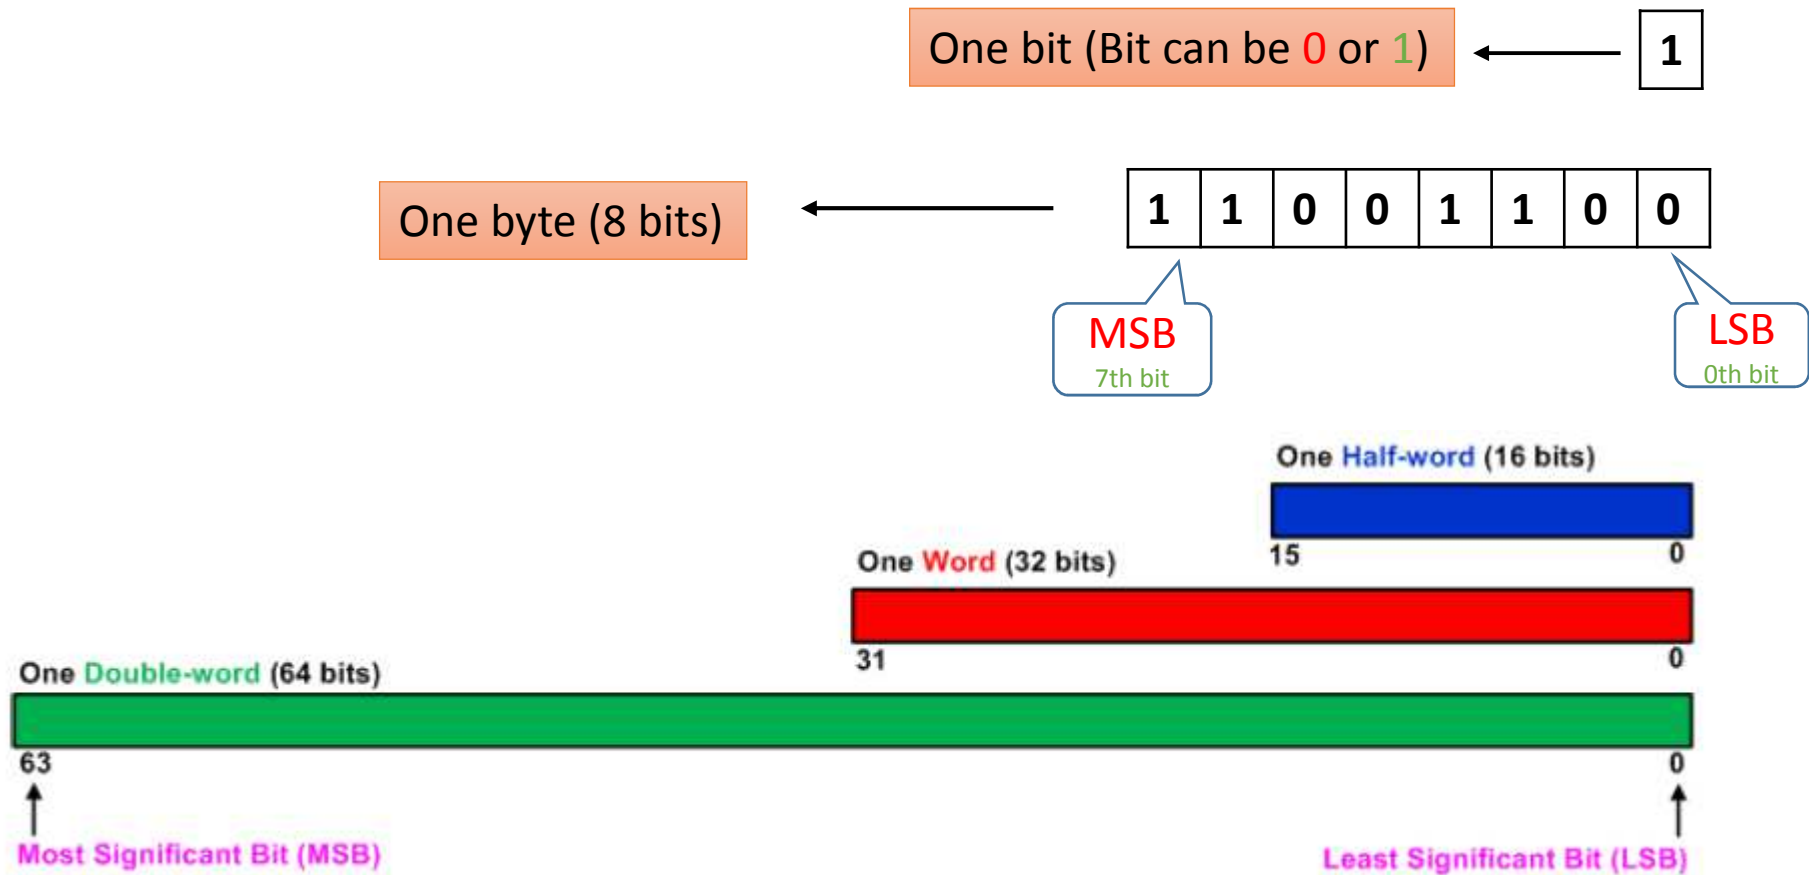

0,1,2,3,4,5,6,7,8,9,A,B,C,D,E,F,10,11,...,1F,20,...,2F,30,.....

Counting in microcontrollers

- Generally, hex numbering is used in debug menu and reference manuals.

Terminologies

Prefixes

Prefixes	Value	Standard form	Symbol
Tera	1 000 000 000 000	10^{12}	T
Giga	1 000 000 000	10^9	G
Mega	1 000 000	10^6	M
Kilo	1 000	10^3	k
deci	0.1	10^{-1}	d
centi	0.01	10^{-2}	c
milli	0.001	10^{-3}	m
micro	0.000 001	10^{-6}	μ
nano	0.000 000 001	10^{-9}	n
pico	0.000 000 000 001	10^{-12}	p

Example:

4 GigaByte memory

$= 4 * 10^9 * 8 \text{ bits}$

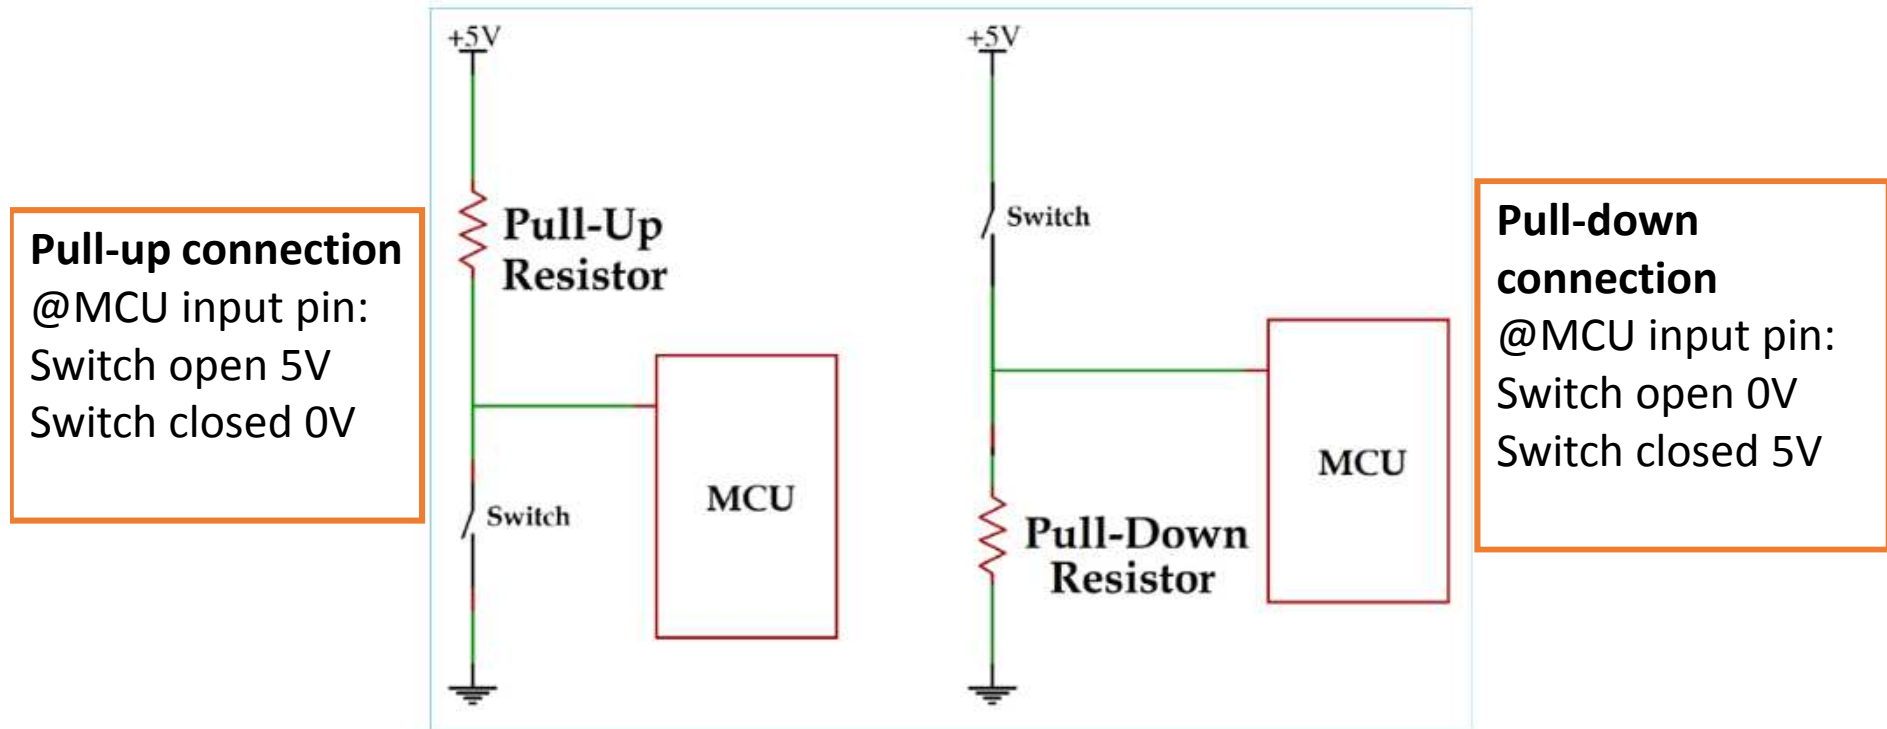

$= 32 * 10^9 \text{ bits}$

Data types

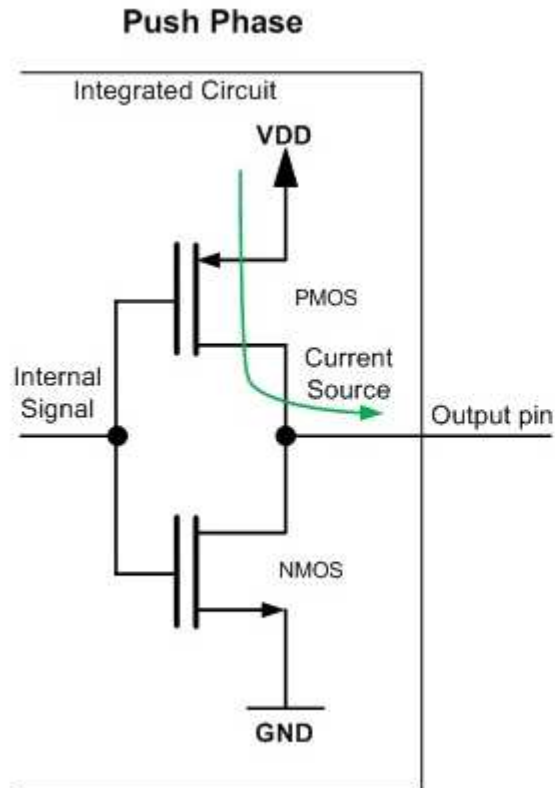

- char, short, integer...
- signed, unsigned

	TYPE	BITS	MINIMUM	MAXIMUM	DECIMAL FORMAT
	Unsigned char	8	0	255	Integer
	Signed char	8	-128	127	Integer
One Word	Unsigned short	16	0	65535	Integer
	Signed short	16	-32768	32767	Integer
	Unsigned int	32	0	4294967295	Integer
Double-Word	Signed int	32	-2147483648	2147483647	Integer
	Float (IEEE754)	32	-3.4028E+38	3.4028E+38	Real number
	Double (IEEE754)	64	-1.7977E+308	1.7977E+308	Real number

Some analog electronic terminologies

Push-Pull

Push phase

Internal signal is low
NMOS OFF, PMOS ON

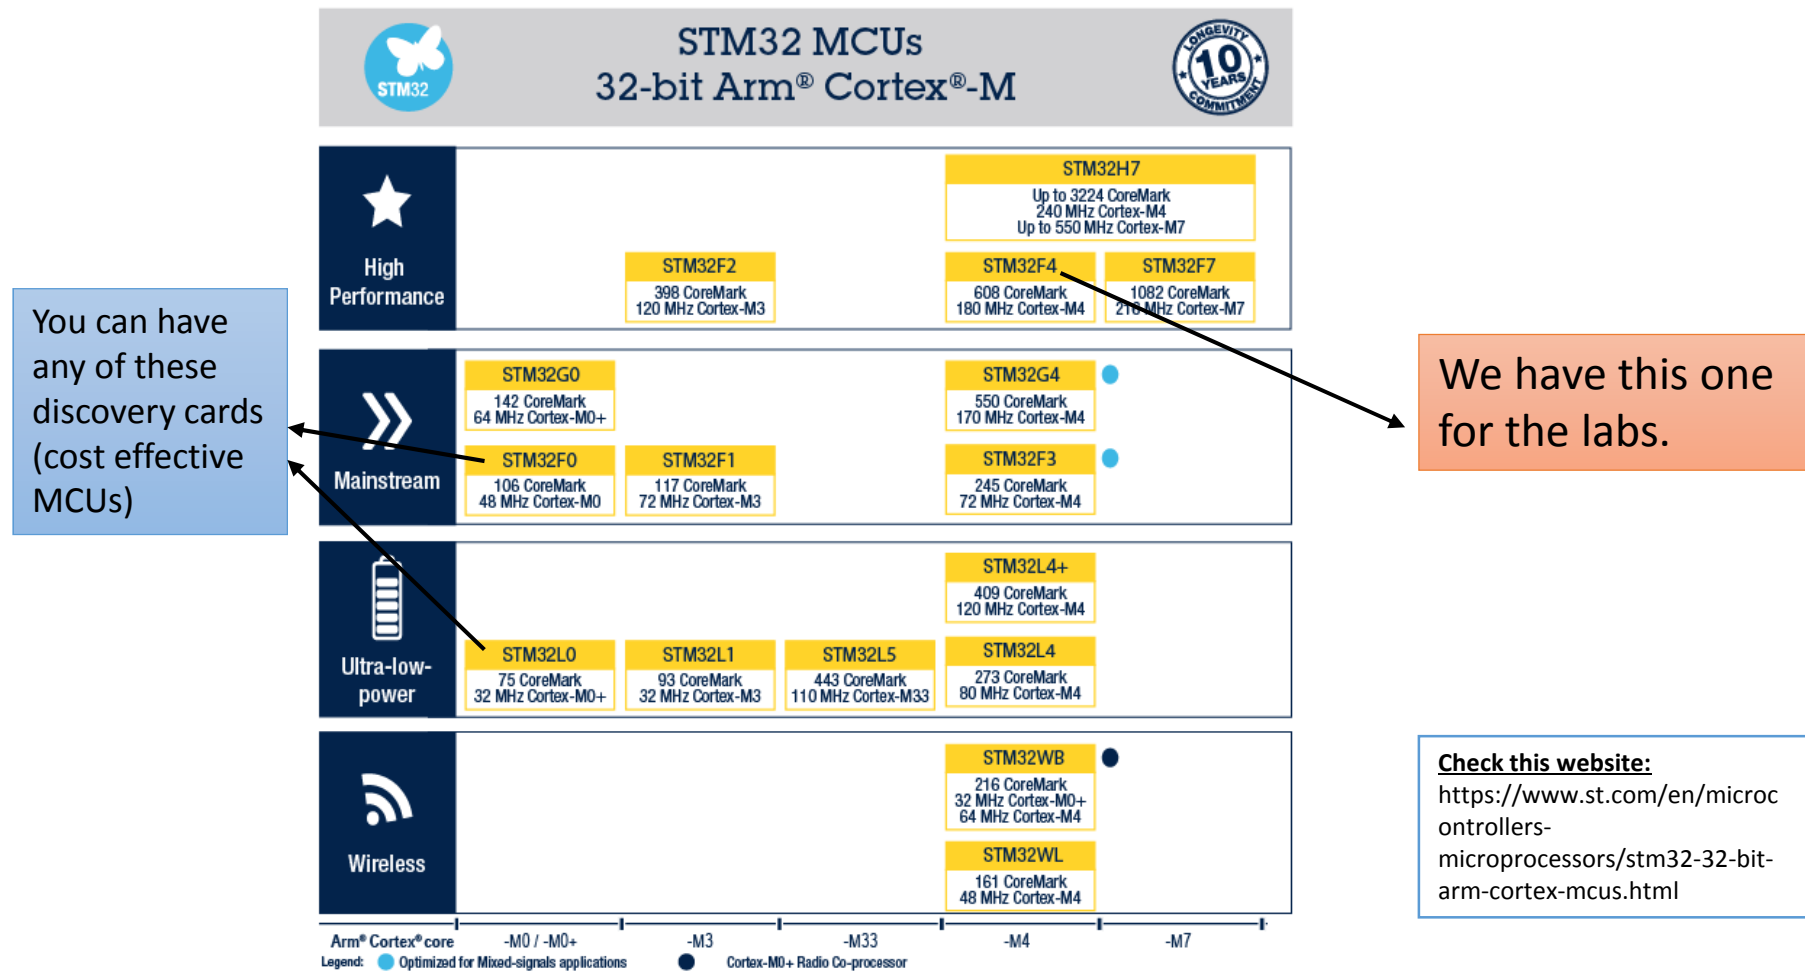

Pull phase

Internal signal is high
NMOS ON, PMOS OFF

STM32 microcontroller family

- ST microelectronics produces different types of 32-bit microcontrollers based on the Arm® Cortex®-M processor.

- The obtained discovery card should have user button and user leds

STM32F4 discovery card

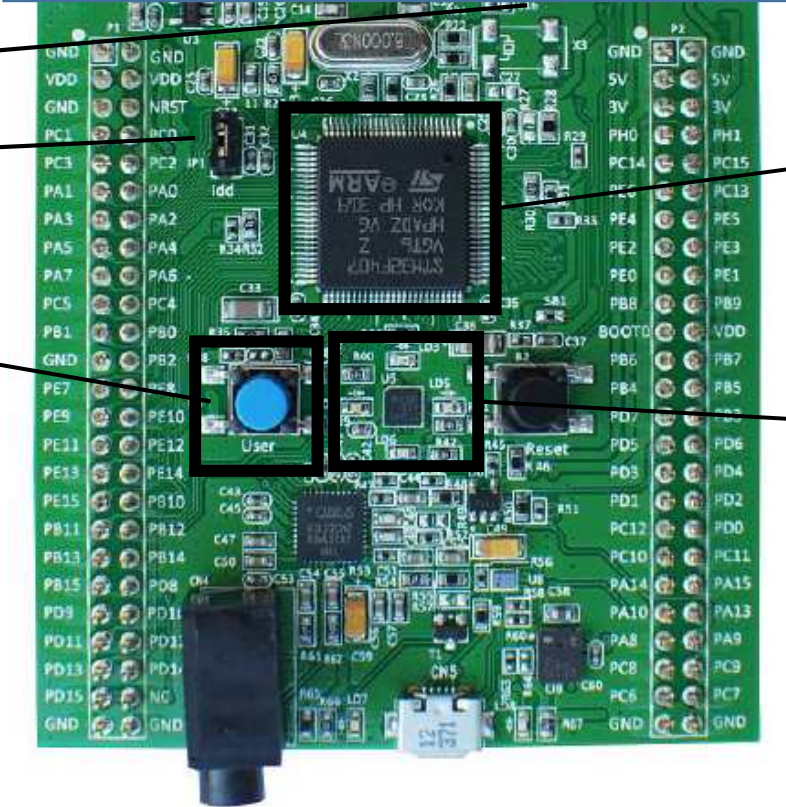

USB-mini USB cable

ST-Link part to program/debug MCU

These jumpers must be on
CN3: to program MCU
JP1: for power

MCU

User button

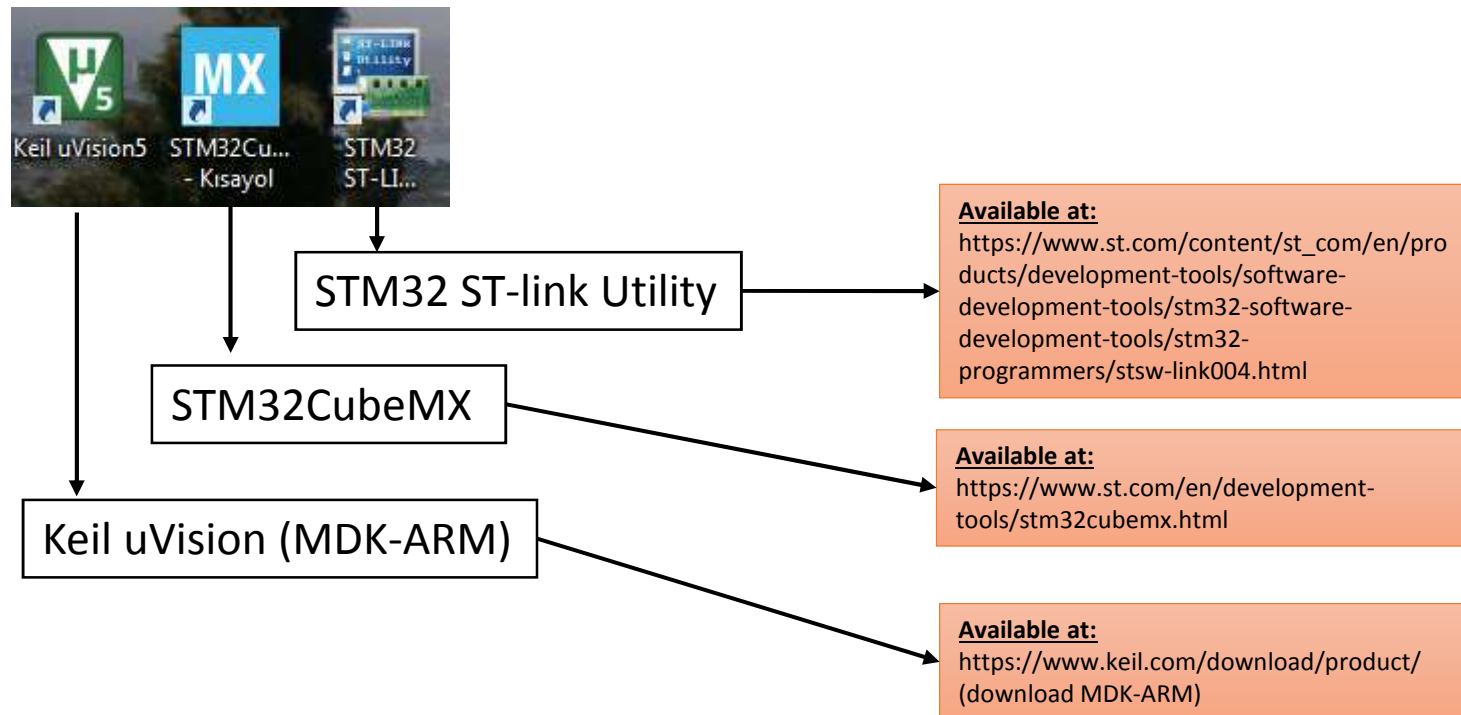

Female-female jumpers for interconnection between pins

Green, orange, red, blue user leds are in this region

- Check out STMF4 user manual

Development toolchains and driver

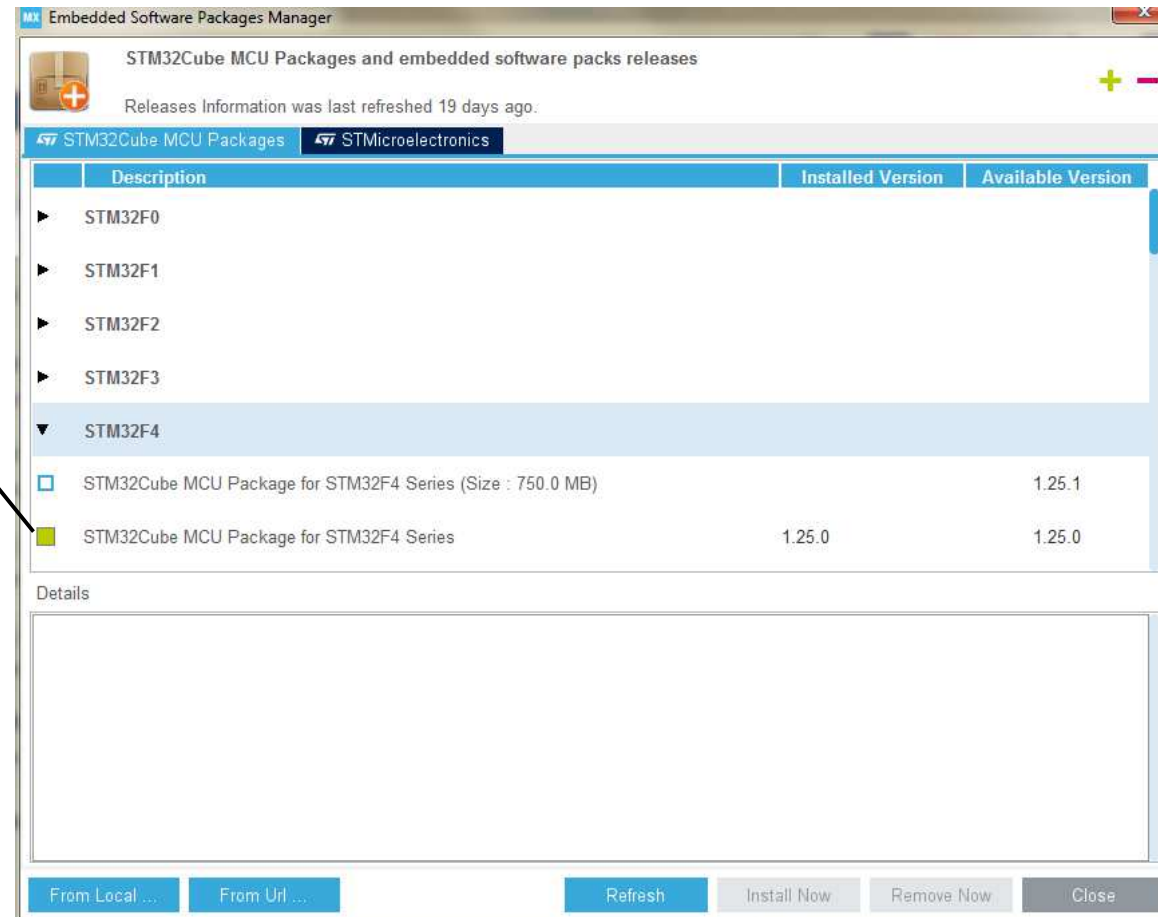

- STM32 ST-link Utility is driver so that computer recognize ST-Link
- STM32CubeMX is for initialization and code generation as template
- Keil uVision (MDK-ARM) is development environment for ARM- Cortex MCU

Development toolchains and driver

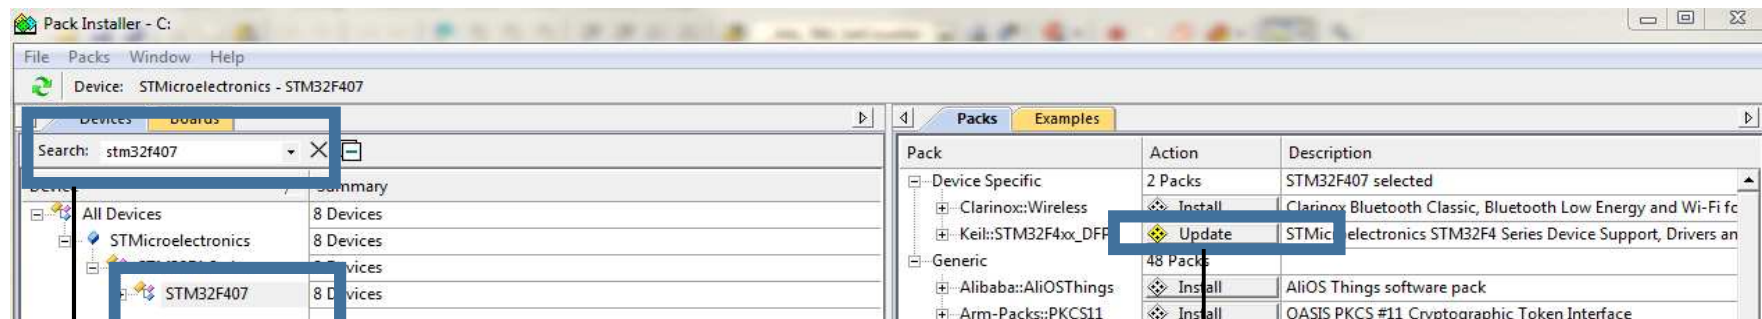

- While installing STM32CubeMX, you may be prompted to install java
- After installation, Help-> Manage embedded software packages

Install package
for your MCU.
Green color
confirms that
package is
intalled

Development toolchains and driver

- After installation MDK-ARM, click on pack installer

Find your board from search menu

Install the indicated pack
